1. Overview

This manual explains all the functions that use Smart DLogger to the beginners to use Smart DLogger. This manual does not require any preliminary knowledge about Smart DLogger but assumed that Windows O/S is available.

1.1 Preparation

Prepare a system before following the manual.

In order to follow the manual, you should install and run Smart DLogger Program in your PC. Smart DLogger may be run using the icon on the desktop or in the Start Menu.

Check that corresponding file is in the position described below.

C:₩Program Files₩GDS-inside2

Check that an internet browser is installed in the PC to use Smart DLogger Program and check the connection with the browser.

1.2 Writing rules

This manual uses following reading rules when explaining works.

- "Click OK" means "Click OK button."
- Smart DLogger main screen, which appears when Smart DLogger is started, is called Main Toolbar in the whole of this manual.

The graphic user interface included in the instructions of this manual is basically operated using a mouse.

1.3 Concept

In this part, main concepts and procedures to be used in this manual are introduced. Such concepts are needed to use and utilize Smart DLogger.

1.3.1 Information on concept

1) Data measurement

Sensors assess the state of an engine. Sensors measure engine parameters and convert the measurements into the values in order to be used by ECU.

Measurement consists of the work to sample and record all the sensor values for a specific period. The records obtained by aforesaid method explain the motions of the engine responding to the set of specific calibration values.

2) Calibration

Calibration is the work to control the engine to show the motions to meet the intension of ECU (Electronic Control Unit). For this, ECU uses a feedback process. It measures the state of the engine using sensors and changes the state of engine using an actuator in order to show the intended motions. It measures and adjusts new state of engine repeatedly until equilibrium state is achieved.

Calibration is a process to adjust feedback parameters to that a car shows intended motions when equilibrium state is achieved. As the state of a car is continuously changed during running, many equilibrium states exist. Such equilibrium state is called a process point, in general. As a car is a nonlinear system, the control algorithm is depended on arithmetic calculation and the values of feedback cannot be determined. Instead, the control algorithm inquires of intended actuator setting values in a specific table set using the sensor values as the reference values for inquiry. Calibration consists of the work to determine the values in a specific table set. Same ECUs cannot have the set of different effective calibration values to implement different engine motions. For example, a set is applied to a high-speed vehicle and another set may be applied to a low fuel-consumption vehicle.

3) Smart DLogger

Smart DLogger provides the users with graphic user interface and the hardware to access ECU in order to support smooth and qualified data measurement.

4) Variables, measurement variables, and calibration variables

The term of variables means measurement variables and all types of calibration variables. In general, measurement variables are transmitted by sensors and may be used as the inquiry values of calibration variables. Also, it is possible to measure induced or calculated property values and measure calibration variables with application of corresponding setting.

Smart DLogger records measurement variables only and analyzes the data.

5) Management of DB

The management data (files of management variables), which meets the symptom of each system of each kind of vehicles for Smart DLogger, is managed by the DB of R&D center server. Accessing the data, reorganizing the data, and generating and managing the data are done through the manager interface in order to use and manage the date efficiently.

6) Symptom

It is the set of measurement variables which meets each symptom of each system.

The symptom is saved in DB. The user may call it and may set the variables to meet the symptom using Smart DLogger.

7) Project

Project is defined as the whole systems related with DLogger measurement and consists of communication speed, DAQ (Data Acquisition) size, and the data sets

that reflect the values of variables. Project is referred to in DB.

8) Configuration of hardware

The configuration of hardware is defined as the hardware that is used for specific work. In case of application hardware, it is defined as the project to be used and corresponding data sets.

9) DLogger analyzer

DLogger Analyzer Program is an offline tool to display and analyze the recorded measurement data. This program is run as an own program screen and is run in display mode or analysis mode. However, online measurement is impossible in case of DLogger Analyzer.

1.3.2 Concept applied to DLogger

Fig. 1-1 shows a process to generate DLogger event data. For example, in case of an engine, when ECU reads the information on ROM ID and VIN and the user selects Symptom, the information is sent to the server, an event file is generated to meet the information, and an event file is generated in DLogger Devices. Therefore, recording is possible when a specific symptom is generated.

Fig. 1-1 DLogger process

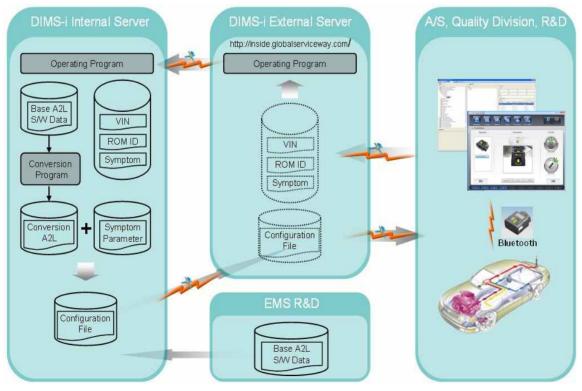

Fig. 1-2 shows vehicle communication network. Where, DLogger collects needed data from each system through communication such as CCP, XCP, KWP DDLI, and CAN monitoring related with vehicle communication. (CCP : Can Calibration Protocol) (XCP : Extended Calibration Protocol) (KWP DDLI : KWP Dynamically Define Local Identifier) (CAN Monitoring)

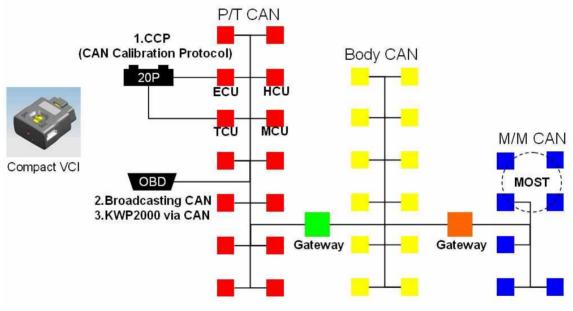

Fig. 1-2 Vehicle communication network

1.4 Overview and Goal

Based on this manual, you may perform the whole process to set the measurement variables to meet the symptom of each system, record data, converts recorded files for analysis programming, and analyze the data, using Smart DLogger Program.

- 1) Installing program: Before installing Smart DLogger Program, you are informed of PC environment setting and program installation/deletion.
- 2) Pairing Bluetooth: You are informed of installation of Bluetooth dongle, the method to pair DLogger devices.
- 3) Updating firmware: You are informed of the method to update DLogger devices.
- 4) Generating Smart DLogger events: You are informed of the method to generate event files to meet the system and symptom using Smart DLogger Program.
- 5) Converting Smart DLogger recording files: You are informed of the method of conversion so that you may see recorded data

using an analysis program after the data is recorded.

6) Analyzing recorded data: You are informed of the method to analyze recorded data using an analysis program.

- 7) DLogger analyzer: You are informed of various functions and methods of analysis programs when analyzing recorded data using analysis programs.
- 8) User site: You are informed of the methods to request analysis and the various functions and analysis of user site.

1.5 Procedure

This manual guides you to each step of work and explains the method to perform suggested works in detail.

- 1.6 Configuration of DLogger hardware
- 1.6.1 Compact VCI
 - 1) Compact VCI (CVCI): Main body that performs communication and recording
 - 2) Trigger module for CVCI : The signal to notice the starting time of manual trigger; recording is done by this signal.
 - SD card: A flash memory card to store event files and recorded data; it supports 4GB basically and up to 64G.
 - 4) USB card reader: A device to recognize SD card as an USB
 - 5) Trigger module extension cable: An auxiliary cable for convenient use of trigger module; the positions of cigar jacks are different depending upon the properties of vehicles.

6) 8 to 20P cable: In case of Mu, Tau, Lambda, and HEV engines, CCP and CAN monitoring lines are at engine room 20-pin cable; this cable is used

when the above engines use CCP and CAN monitoring communication.

(It is used when engine room 20-pin cable has the pin for power and earth)

7) Bluetooth dongle: A Bluetooth device to be used after installation in the external USB when PC has not Bluetooth device

8) Industrial SD card (optional): When Compact VCI is installed in the engine room,

more reliable data may be stored in this media in bad

environment in terms of temperature and vibration, etc.

9) 16 to 20P cable (optional): In case of Mu, Tau, Lambda, and HEV engines, CCP and CAN monitoring lines are at engine room 20-pin cable

; this cable is used when those engines use CCP and CAN

monitoring communication.

(It is used when engine room 20-pin cable has no pins for power and earth) 10) Body CAN cable (optional): It is used for body CAN monitoring.

3) SD card

4) USB Card Reader

5) Extension Cable (for Trigger Module)

6) 8 to 20P Cable (for Lambda, Mu, Tau)

7) Bluetooth Dongle

9) 16 to 20P Cable (for Lambda, Mu, Tau) (Optional)

10) Body CAN Cable (Optional)

Fig. 1-4 Specification of SD card

Size I doptal campras o	ng PL 32mm x 24mm x 2.1mm pagamas			
Op. Voltage	2.7V~3.6V			
Op. Temperature	-25°C(-13°F) ~ 85°C(185°F)

Specification of common SD card

 Interface(connector) 	SD flash card connector
Form Factor	SDHC flash card
Flash Type	SLC
Capacity(GB)	4GB
Max. R/W Performance(MB/s)(Vary by density)	Read: 18MB/s, Write: 14MB/s
Op. Voltage(V)	2.7V~3.6V
Power Consumption(W)	0.72W
 Op. Temp.(°C) 	- 40°C ~ 85°C
Storage Temp.(°C)	- 40℃~ 85℃
 Humidity(%) 	0%~95%
 Shock(G) 	600G
Vibration(Hz/G)	20G (Peak-to-Peak), 20Hz to 2000Hz(Frequency)
Dimensions(mm)	24mm × 32mm × 2.1mm
 MTBF(hours) 	1,000,000 hours

Specification of industrial SD card

1.6.2 VCI-II

1) VCI-II: Main body that performs communication and recording

2) Trigger module for VCI-II : The signal to notice the starting time of manual trigger; recording is done by this signal.

3) Trigger module extension cable: An auxiliary cable for convenient use of trigger module; the positions of cigar jacks are different depending upon the properties of vehicles.

4) 30pin to USB cable : This cable is used when to connect VCI-II and PC.

5) Bluetooth dongle: A Bluetooth device to be used after installation in the external USB when PC has not Bluetooth device

6) 30pin to 20pin cable : In case of Mu, Tau, Lambda, and HEV engines, CCP and CAN monitoring lines are at engine room 20-pin cable; this cable is used when the above engines use CCP and CAN monitoring communication. (It is used when engine room 20-pin cable has the pin for power and earth)

7) 16 to 20P cable (optional): In case of Mu, Tau, Lambda, and HEV engines, CCP and CAN monitoring lines are at engine room 20-pin cable
; this cable is used when those engines use CCP and CAN monitoring communication. (It is used when engine room 20-pin cable has no pins for power and earth)

8) Body CAN cable (optional): It is used for body CAN monitoring.

Fig. 1-5 VCI-II

1) VCI-II

3) Trigger module extension cable

5) Bluetooth dongle

7) 16pin to 20pin cable (optional)

2) Trigger module for VCI-II

4) 30pin to USB cable

6) 30pin to 20pin cable

8) Body CAN cable (optional)

1.6.3 CVCI-II

1) CVCI-II: Main body that performs communication and recording

2) Trigger module for CVCI-II : The signal to notice the starting time of manual trigger; recording is done by this signal.

3) Trigger module extension cable: An auxiliary cable for convenient use of trigger

module; the positions of cigar jacks are different depending upon the properties of vehicles.

4) 30pin to USB cable : This cable is used when to connect CVCI-II and PC.

5) 30pin to 20pin cable : In case of Mu, Tau, Lambda, and HEV engines, CCP and CAN monitoring lines are at engine room 20-pin cable; this cable is used when the above engines use CCP and CAN monitoring communication. (It is used when engine room 20-pin cable has the pin for power and earth)

6) Body CAN cable : It is used for body CAN monitoring.

7) CAN Monitoring cable : This cable is used when CAN Monitoring symptom.

8) 16 to 20P cable (optional): In case of Mu, Tau, Lambda, and HEV engines, CCP and CAN monitoring lines are at engine room 20-pin cable
; this cable is used when those engines use CCP and CAN monitoring communication. (It is used when engine room 20-pin cable has no pins for power and earth)

Fig. 1-6 CVCI-II

3) Trigger module extension cable

4) 30pin to USB cable

5) 30pin to 20pin cable

7) CAN Monitoring cable

6) Body CAN cable

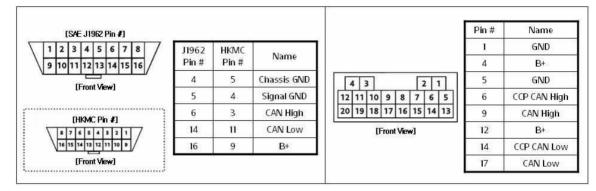

8) 16pin to 20pin cable (optional)

1.6.4 Information on diagnosis connector pins

OBD 16-pin connector is the standard but the specification of engine room 20-pin connector may not have some pins depending upon vehicle.

Fig. 1-7 Information on diagnosis connector pins

Indoor 16-Pin Connector

Engine 20-Pin Connector

1.7 Situation of application of DLogger

The communication line was changed from K line to CAN in 2007 and DLogger supports the vehicles to which CAN was applied since 2007. It supports the whole systems including engine, transmission, and body system.

1.7.1 Protocol

In terms of protocol, it supports CCP (Can Calibration Protocol), XCP (Extended Calibration Protocol), KWP DDLI (Dynamically Define Local Identifier), and CAN Monitoring.

1.7.2 System

The systems to which DLogger is applied are shown in the table.

Fig. 1-8 Situation of DLogger application

2. Installing programs

This chapter has the title of "Installing programs" and informs all the users, who install and maintain Smart DLogger Program, of the detailed procedures to install and delete the program in/from PC.

2.1 Setting PC environment before installing programs

Before installing Smart DLogger Program, check the setting of PC environment. The system requirements may be changed depending upon the O/S of user's PC. Smart DLogger Program supports Windows 7 32/64bit O/S and service pack 1.

2.2 Installing Smart DLogger Program

For installation of Smart DLogger Program, log in the site of http://inside.globalserviceway.com/; Downloaded program is compressed; decompress the file and run the execution file, SmartDLogger_v3.1.0.5.exe.

Fig. 2-1 Downloading Smart DLogger Program

3. Pairing Bluetooth

This part introduces all the procedures for pairing Bluetooth in PC and Smart DLogger to all users.

3.1 Information on concept

The communication between DLogger devices (Compact VCI, VCI-II, CVCI-II) used by Smart DLogger and PC adopts Bluetooth wireless communication. Therefore, in order to use DLogger devices, you need to pair Bluetooth once at initial step.

Fig. 3-1 Conceptual diagram of Smart DLogger communication

3.2 Installing a Bluetooth dongle

If no Bluetooth device is installed in PC, you may use Bluetooth dongle after installing it in an external USB.

3.2.1 Installing Bluetooth dongle hardware

Bluetooth dongle is included in the hardware set of Smart DLogger. If you have no Bluetooth device in your PC, you may use it after inserting it in a USB.

3.2.2 Installing Bluetooth dongle software

In order to install a Bluetooth dongle, you should install corresponding software. Download the software for Bluetooth dongle from Library of user site and install it. <u>http://inside.globalserviceway.com</u> -> Library -> Bluetooth Dongle Software

Fig. 3-2 Downloading Bluetooth dongle software

3.3 Pairing Compact VCI Bluetooth

This part introduces the detailed method of Bluetooth pairing for Compact VCI.

Bluetooth program may be somewhat different depending upon the user's PC.

3.3.1 Pairing Compact VCI in Smart DLogger

Open Smart DLogger Program secondly and perform Bluetooth pairing after selecting Setup in the toolbar at the top of Smart DLogger.

You may register Bluetooth pairing of Compact VCI in the order of Setup -> Search -> Register.

Fig. 3-4 Screen showing Compact VCI pairing in Smart DLogger.

1) Select Setup of device in the toolbar at the top of Smart DLogger.

3.4 Pairing Trigger Module for CVCI Bluetooth

This part introduces the detailed method of Bluetooth pairing for Trigger Module for CVCI. The case that Bluetooth pairing is needed for Trigger Module for CVCI is the

case that firmware update is needed for Trigger Module for CVCI.

3.4.1 Pairing Trigger Module for CVCI in Smart DLogger

Open Smart DLogger Program secondly and perform Bluetooth pairing after selecting Setup in the toolbar at the top of Smart DLogger.

You may register Bluetooth pairing of Trigger Module for CVCI in the order of Setup

-> Search -> Register.

Fig. 3–5 Screen showing Trigger Module pairing in Smart DLogger.

1) Select Setup of device in the toolbar at the top of Smart DLogger.

3.5 Pairing Compact VCI with Trigger Module for CVCI

Compact VCI and Trigger Module for CVCI are paired when you purchased the equipment. This pairing is required if you want pairing again during use of the equipment or if you want pairing of the equipment that has been used mixed with other equipment.

3.5.1 Pairing 1 set of Compact VCI (1:1)

This part introduces the method to pair one Compact VCI and one Trigger Module for CVCI 1-to-1. The method of Bluetooth pairing is as follows.

- Put Compact VCI in OBD terminal and push the pairing switch of Compact VCI.
 When setting is completed, green and red colors are turned on alternately in 1Hz.
 Pairing standby mode is maintained for 60 seconds.
- Insert Trigger Module in the cigar jack and push Enter Key of Trigger Module for 5 seconds or longer.

Beep sound is heard, Enter Key is changed to orange color

(If both green and red colors are turned on), and LED of VCI2 is rapidly changed to red alternately.

When Compact VCI to be paired is searched, CAN1 of VCI1 is changed to green; search the second Compact VCI.

When try paring for 20-second, a sound is heard and original state is restored. (Although search is completed, search state is maintained for 20 seconds.)

- 3) If CAN1 is not changed to green, it means pairing failure and the processes of 1 and 2 should be repeated.
- 4) If the process is completed, disconnect and connect the power for Compact VCI and Trigger Module.

Fig. 3-6 CVCI paring switch

Fig. 3-7 Trigger Module for CVCI LED

3.5.2 Pairing 2 sets of Compact VCI (1:2)

This part introduces the method to pair two Compact VCI and one Trigger Module for CVCI 1-to-2. The method of Bluetooth pairing is as follows.

- Put Compact VCI in OBD terminal and push the pairing switch of Compact VCI.
 When setting is completed, green and red colors are turned on alternately in 1Hz.
 Pairing standby mode is maintained for 60 seconds.
- 2) Insert Trigger Module for CVCI in the cigar jack and push Enter Key of Trigger Module for CVCI for 5 seconds or longer. Beep sound is heard, Enter Key is changed to orange color (if both green and red colors are turned on), and LED of VCI2 is rapidly changed to red alternately.

When the first Compact VCI to be paired is searched, CAN1 of VCI1 is changed to green.

3) Where, take out the first Compact VCI, insert the second Compact VCI in OBD terminal, and push the pairing switch of Compact VCI When Trigger Module for CVCI searches 2 CVCI, CAN2 is changed to green.

When try pairing for 20-second, a sound is heard and original state is restored. (Although search is completed, search state is maintained for 20 seconds.)

- 4) If CAN1 and CAN2 are not changed to green, it means pairing failure and the processes of 1 and 2 should be repeated.
- 5) If the process is completed, disconnect and connect the power for Compact VCI and Trigger Module for CVCI.

3.6 Paring VCI-II Bluetooth

Open Smart DLogger Program secondly and perform Bluetooth pairing after selecting Setup in the toolbar at the top of Smart DLogger.

You may register Bluetooth pairing of VCI-II in the order of Setup -> Search -> Register. Refer to "3.3 Pairing Compact VCI Bluetooth"

3.7 Pairing VCI-II with Trigger Module for VCI-II

VCI-II and Trigger Module for VCI-II are paired when you purchased the equipment. This pairing is required if you want pairing again during use of the equipment or if you want pairing of the equipment that has been used mixed with other equipment.

The method of Bluetooth pairing is as follows.

- Put VCI-II in OBD terminal and push the pairing switch of VCI-II.
 When setting is completed, green and red colors are turned on alternately in 1Hz.
 Pairing standby mode is maintained for 60 seconds.
- Insert Trigger Module in the cigar jack and push Enter Key of Trigger Module for 5 seconds or longer.

Beep sound is heard, Enter Key is changed to green and red colors are changed, and LED of A row and B row is rapidly changed to red alternately.

When VCI-II to be paired is searched, VCI II of A is changed to green; search the second VCI-II.

When try paring for 20-second, a sound is heard and original state is restored. (Although search is completed, search state is maintained for 20 seconds.)

- 3) If VCI II is not changed to green, it means pairing failure and the processes of1), 2) should be repeated.
- 4) If the process is completed, disconnect and connect the power for VCI-II and Trigger Module for VCI-II.

Fig. 3-8 VCI-II Paring switch

Fig. 3-9 Trigger Module for VCI-II LED

3.8 Paring CVCI-II Bluetooth

Open Smart DLogger Program secondly and perform Bluetooth pairing after selecting Setup in the toolbar at the top of Smart DLogger.

You may register Bluetooth pairing of CVCI-II in the order of Setup -> Search -> Register. Refer to "3.3 Pairing Compact VCI Bluetooth"

3.9 Pairing CVCI-II with Trigger Module for CVCI-II

CVCI-II and Trigger Module for CVCI-II are paired when you purchased the equipment. This pairing is required if you want pairing again during use of the equipment or if you want pairing of the equipment that has been used mixed with other equipment. The method of Bluetooth pairing is refer to "3.7 Pairing VCI-II with Trigger Module for VCI-II".

Fig. 3-10 CVCI-II Paring switch

4. Updating firmware

4.1 Compact VCI firmware

In case of Compact VCI, it is needed to improve the operational functions of communication or data recording, etc. or additional functions are generated, you need to update firmware.

4.1.1 Automatic firmware

If you use Smart DLogger Program after pairing Compact VCI and if the firmware of Compact VCI is updated, the version of firmware is automatically checked and firmware is automatically updated before generating an event file.

4.1.2 Manual firmware

You may open Smart DLogger Program in the mode that you want to update the firmware manually and you may update firmware of Compact VCI after selecting FW Update in the toolbar at the top of Smart DLogger.

For updating the firmware, Compact VCI to be updated should be paired. For pairing method, refer to "3.3 Pairing Compact VCI Bluetooth."

Fig. 4-1 Compact VCI firmware

1) Select FW Update in the toolbar at the top of Smart DLogger.

2) Update Compact VCI firmware.

4.2 Trigger Module for CVCI firmware

In case of Trigger Module for CVCI, if the functions of operation to be improved or additional functions are generated, you should update the firmware. If the functions are updated, notification of update appears through Smart DLogger Program and user site and then you should update the firmware manually. You may open Smart DLogger Program and may update the firmware of Trigger Module for CVCI after selecting FW Update in the toolbar at the top of Smart DLogger For updating the firmware, Trigger Module for CVCI to be updated should be paired. For pairing method, refer to "3.4 Pairing Trigger Module Bluetooth."

5. Smart DLogger Program

Smart DLogger Program may be easily used by a beginner to select intended system symptom rapidly and to record high-quality data.

5.1 Explanation of functions

You may perform the whole process to set the measurement variables to meet the symptom of each system, record data, converts recorded files for analysis programming, and analyze the data, using Smart DLogger Program. Smart DLogger may provide proper support only when internet is connected.

The functions in the toolbar at the top of Smart DLogger are as described below.

Fig. 5-1 Toolbar at the top of Smart DLogger

1) Initialization: You may go to initial screen.

 Convertor: Data is converted so that you may see recorded data using an analysis program after the data is recorded.

- 3) Analyzer: It starts analysis of recorded data.
- 4) Setup: It pairs DLogger devices (Compact VCI, Trigger module for CVCI, VCI-II,

CVCI-II) and store and manage corresponding information.

- 5) FW Update: It updates the firmware of DLogger devices (Compact VCI, Trigger module for CVCI, VCI-II, CVCI-II).
- 6) User Option: It supports setup type, mileage type, skin theme, language, selection of data folder position, and initialization of options.
 - * Setup Type Auto, Manual
 - * Mileage Type mile, km
 - * Skin Theme Hyundai (Blue)
 - * Language Korean, English, Chinese, Deutsch, Español
 - * Data Folder C:\Program Files\GDS-inside2\SmartDLogger\ProjectData
 - * Option Initialization Initialization option information
 - * Homepage DLogger user web site link

5.2 Generating events

You may generate event files to meet the system and symptom using Smart DLogger Program. Insert DLogger devices (Compact VCI, VCI-II, CVCI-II) in the OBD terminal of the vehicle and proceed the contents of instructions given by Smart DLogger Program. When the information on VIN and ROM ID and the information on the symptom you selected is sent to the server through DLogger devices (Compact VCI, VCI-II, CVCI-II), the event file is generated to meet the information and is sent to your PC in order to generate the event file in DLogger devices (Compact VCI, VCI-II, CVCI-II) through Bluetooth.

5.2.1 Information on events

The file names of events are automatically generated in the order of date and time. Two event files (evt file and dat file) are generated: evt file has the information related with variables and dat file has the contents related with communication. (ex. 20130807053038.evt / config.dat)

5.2.2 Automatic generation

This function is used when a vehicle is available and you generate events after inserting DLogger devices (Compact VCI, VCI-II, CVCI-II) in the OBD terminal. DLogger devices (Compact VCI, VCI-II, CVCI-II) should be paired with PC in advance. If DLogger devices (Compact VCI, VCI-II, CVCI-II) is not paired, generate events after pairing referring to "3.3 Pairing Compact VCI Bluetooth."

Fig. 5-3 Generation of events – Automatic setup (for example CVCI) 1) Login

2) Insert Compact VCI in the OBD terminal and turn IG Key ON.

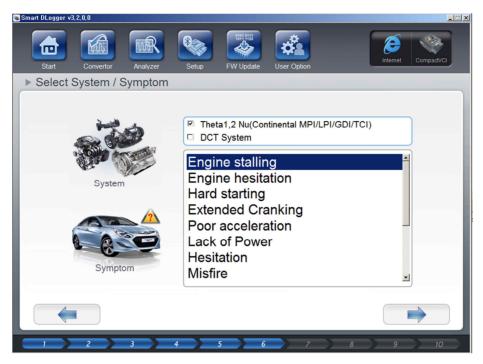

3) Confirm communication and IG-ON.

4) ROM ID and VIN is automatically searched (If VIN is not inputted, input it manually.)

5) Select symptom.

6) Generate events.

7) Insert Trigger Module in the cigar jack.

8) Completion of generation of events

5.2.3 Manual generation

You may use this function if no vehicle is available and if you intend to generate and use event files only or support a far external part with event files. For this, you should know the ROM ID, VIN, and symptom of the vehicle.

You may store the event files in an intended position.

Fig. 5-4 Generation of events - Manual setup : CVCI

5.3 Conversion of recording files

When data is recorded, a recording file is stored in the SD card of Compact VCI after raw formatting (with extension of rem). (ex. 20130705–100755.rem)
As this data is raw communication format data, it should be converted into physical data so that common users may easily identify it. This function is conversion.
When you execute conversion, a gdl file for programming DLogger analysis and a dat file in INCA MDA format to be used by the R&D center are generated. The reason for generating the dat file is to help researchers to analyze the data easily when the data is sent to the R&D center.

5.3.1 gdl file

It is an exclusive DLogger gdl file that may be analyzed using a DLogger Analysis program.

DLogger Viewer is also supported to analyze dat files.

(ex. 20130806-101227_Lack of Power.gdl)

5.3.2 dat file

It is exclusive MDA dat file to be analyzed by INCA MDA that is used in the R&D center. (ex. 20130806-101227_Lack of Power.DAT)

5.4 Analyzing recorded data

If a recording file is converted, you may analyze the data using a DLogger analyzer. Detailed method to use the analyzer will be explained in detail in "6. DLogger Analyzer."

6. DLogger analyzer

DLogger Analyzer Program is an offline tool to display and analyze the recorded measurement data. This program is run as an own program screen and is run in display mode or analysis mode.

However, online measurement is impossible in case of DLogger Analyzer.

6.1 Explanation of functions

The DLogger analyzer helps you to perform the whole work from setting measurement variables to analysis of data smoothly in order to analyze the symptom and cause of recorded data.

The functions in the main menu and toolbar of the DLogger analyzer are as described below.

Fig. 6-1 Main screen of DLogger analyzer

- 7) Select <New Oscilloscope> and click OK.
- 8) Select <one axis per signal> and click OK.

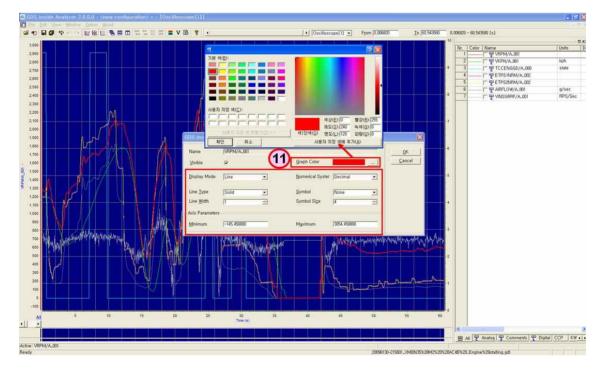

9) A new oscilloscope window is opened.

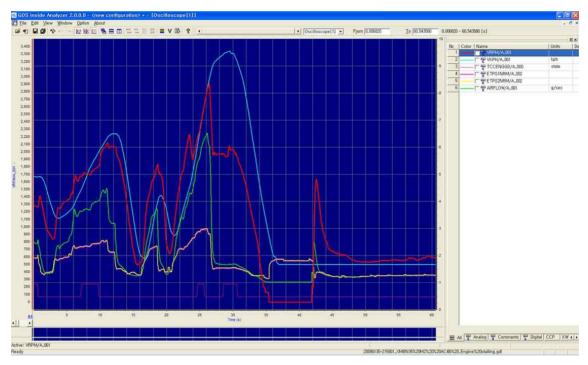

10) Select a variable and select Signal Configuration.

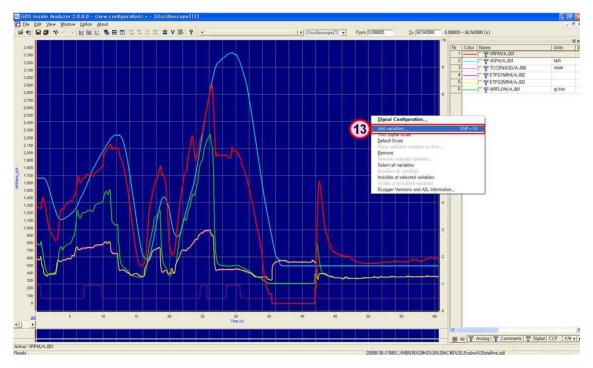

11) Set color and line width, etc. and click OK.

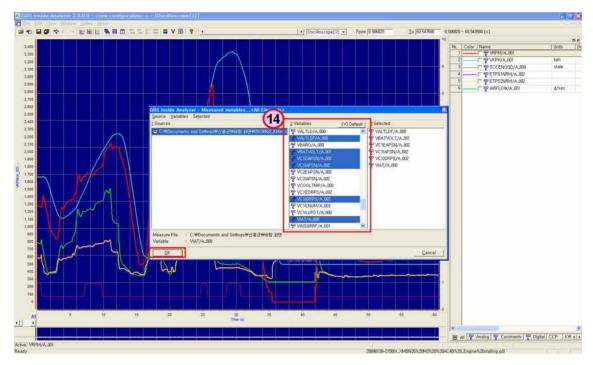

12) Data is analyzed.

13) Select Add variables.

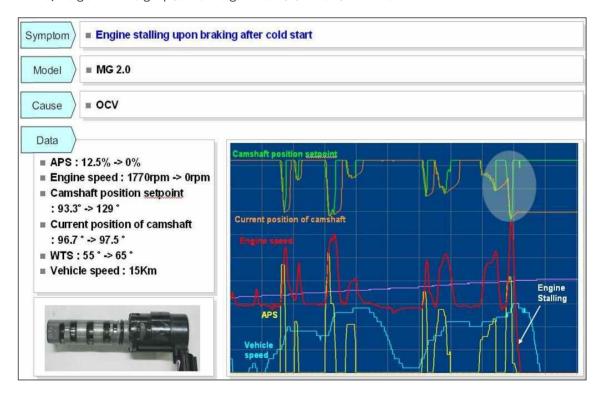

15) Data is analyzed.

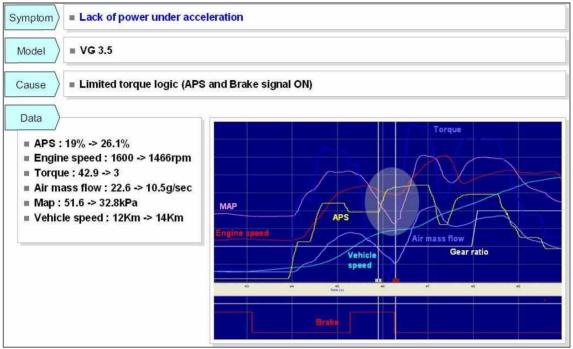

6.3 Cases of analysis

This part introduces 5 examples of recorded data analysis.

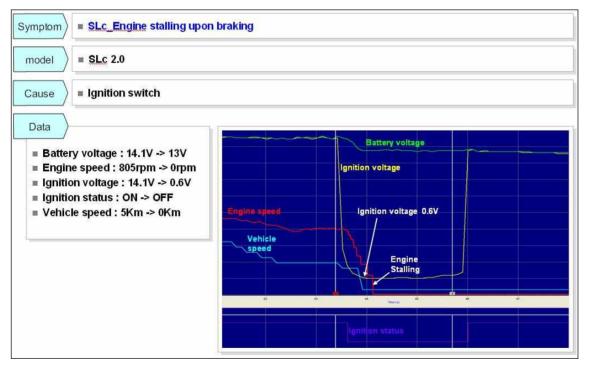

1) Engine stalling upon braking after cold start of MG 2.0

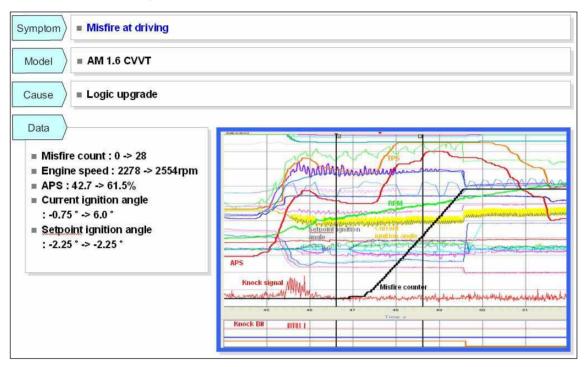

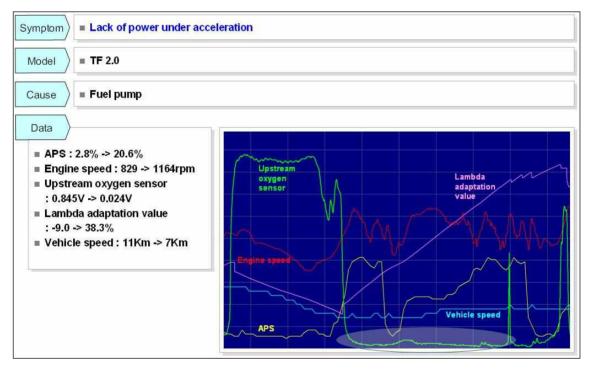

3) Engine stalling upon braking of SLc 2.0

4) Misfire at driving of AM 1.6

5) Lack of power under acceleration of TF 2.0

7. User site

User site is the website for all the users of DLogger Program and is used to request the authority related the use of DLogger, share the data such as programs and manuals, notify the content of program update, request analysis of recorded data, request improvement of programs and errors, and share examples. The address is <u>http://inside.globalserviceway.com</u>.

7.1 How to request authority

To use DLogger Program, you should request the authority and obtain the approval.

7.1.1 Case of a Hyundai employee

An employee should check and write all the items in the registration screen, request the authority, and obtain the approval, too, in order to use DLogger Program. The ID is the employee number.

Fig. 7-1 How to request right - Employee

inside

			Cancel Register
nformation			
Member Information			
GSW Area *		Company*	Hyundai 🗸
Distributor *		Dealer	
User ID *	Confirm		
Name *	j j	Nation *	
Phone		E-mail*	
Team Code		Team	

7.1.2 Case other than an employee

The person other than an employee should write all the items and obtain the approval in the non-member registration screen to use the functions. The applicant should write the ID.

			Cancel
ation lember Informati	on		
GSW Area *		Company *	
Distributor		Dealer	
Distributor User ID *	Confir		
	Confir		
User ID *		m)	

7.1.3 Password policy

1) Login

In case of login for the first time, a page appears to change initial password. The password should consist of the combination of 8 or more English letter(s), figure(s), and specific letter(s) or 10 or more English letter(s) and figure(s). Failure in login is accumulated and the account is blocked in case of 5 times of login failure.

If 6 months (180 days) or longer period has elapsed since change of the password, the password should be changed.

If 90 or more days have elapsed since lost login, the account enters into dormancy state.

2) Re-issuance of password

If the member ID, name, and e-mail of previously registered member are consistent, request for re-issuance is completed.

When the manager registers the authority, the authority is notified by e-mail to the user with initial password.

If the user logs in for the first time, a page appears to change initial password.

7.2 Notice

Details of program update and other matters are noticed.

Fig. 7-3 Matters of Notice

7.4 Request for analysis

A DLogger user may use the webpage to be supported with analysis of recorded data. It consists of 3 screens: My Document, Analysis List, and BookMark List.

My Document consists of Temporary List prepared by login user, Analysis List, Return List, and Solved List.

Request List is the list of the requests made by the users in the same area with the login user.

If a login user mark in Request List, confirmation is possible in BookMark List.

7.5 Community

Community consists of Inside Report and Case Bank. Inside Report is the web page that DLogger users may suggest the maters for improvement of the program and request correction of errors.

Case Bank is the web page that DLogger users may share the cases, which were certainly improved through analysis after recording, with other DLogger users.

8. How to utilize DLogger devices

DLogger users are classified into Smart DLogger users and Expert DLogger users. In general, Smart DLogger is used by the employees of service centers, overseas distributors and dealers.

Smart DLogger users generate events and record and analyze data using Smart DLogger usually but, if it is needed to record additional variables or if it is required for the R&D center to record specific variables, the user may record the data with the support of event files from quality team or head office and may be supported with analysis.

This page introduces all the cases of utilization of DLogger device to record data using Smart DLogger or the support of event files.

- 8.1 Utilizing 1 set of DLogger devices
 - 8.1.1 Connecting and using indoor OBD terminal
 - * Gasoline engine

Kefico - Alpha 2, Gamma, Epsilon, Kappa, Lambda, and Nu engines Continental - Theta 1, Theta 2, and Nu engines, etc

* Diesel engine

Bosch - U, U2, D, A, A2, S, S2, and R engines

Delphi - J2.9, U2 1.4, and A2 engines

* Automatic transmission

New small, current generation, new generation 4/5 speed,

Front/Rear 6/8 speed

* CAN monitoring

HEV (C-CAN)

- 8.1.2 Connecting and using engine room 20-pin terminal
 - * Gasoline engine

Delphi - Lambda 1, Lambda 2, and Mu engines

Kefico - Tau engine

Continental - HEV (Theta and Nu engines)

* CAN monitoring

HEV (H-CAN) - 1 channel

HEV : Engine room 20-pin terminal (H-CAN) + Indoor OBD terminal (C-CAN) - 2 channels

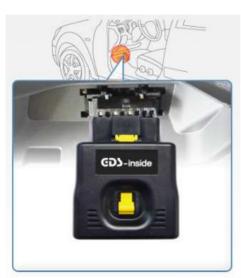

Fig. 8-3 Connecting and using indoor OBD terminal

1) CVCI

3) CVCI-II

Fig. 8-4 CVCI : Connecting and using engine room 20-pin terminal

- Use of additional 8-to-20-pin cable in the state of connection of CVCI OBD terminal

Fig. 8-5 VCI-II : Connecting and using engine room 20-pin terminal

- Use of additional 8-to-20-pin cable in the state of connection of VCI-II OBD terminal

Fig. 8-6 CVCI-II : Connecting and using engine room 20-pin terminal

- Use of additional 30pin-to-20-pin cable in the state of connection of CVCI-II OBD terminal

- 8.1.3 Connecting and using body CAN terminal
 - * Body CAN monitoring

Fig. 8-7 Connection and use of body CAN

1) Compact VCI

2) VCI-II

3) CVCI-II

8.2 Utilizing 2 set of Compact VCI

If you intend to use 2 sets of Compact VCI, generate the event files manually or insert SD card with support.

There may be many cases to use 2 sets of Compact VCI using various sets of combination such as CCP (Can Calibration Protocol), XCP (Extended Calibration Protocol), KWP DDLI (Dynamically Define Local Identifier), and CAN Monitoring of the system and Channels 1/2. Two cases are introduced below.

1) HEV CAN Monitoring

CVCI 1 : Engine room 20-pin terminal H-CAN monitoring

CVCI 2 : Indoor OBD terminal C-CAN monitoring

2) Engine + Body CAN Monitoring

CVCI 1 : Engine room 20-pin terminal Mu/Lambda/Tau engine CCP recording

CVCI 2 : Indoor OBD terminal body CAN monitoring
